

v0.3 Pre-Flight Drift Check — State Machine

Operator-Grade Conflict Resolution with Lineage & Override Channels

Transition Reference Table

#	FROM → TO	TRIGGER	PATH TYPE	DESCRIPTION
01	start → loadSignals	init	Neutral	Pipeline initialization; begin signal acquisition
02	loadSignals → compareManifests	signals_loaded	Neutral	All drift signals acquired from source & target manifests
03	loadSignals → abort	signal_error	Error	Fatal error during signal load; cannot proceed
04	compareManifests → syncAllowed	clean	Clean	No drift detected; manifests match — sync is safe
05	compareManifests → detectConflict	drift_detected	Drift	One or more drift deltas found between manifests
06	detectConflict → syncAllowed	no_conflict	Clean	Drift is benign (cosmetic/informational); no blocking conflict
07	detectConflict → classifyConflict	conflict_found	Drift	Drift constitutes a blocking conflict requiring classification
08	classifyConflict → attachLineage	classified	Drift	Conflict assigned a class (Schema Value Structural Semantic)
09	attachLineage → applyOverrideCode	lineage_attached lineage_p...	Drift	Lineage chain bound to conflict; propagation to descendants complete

#	FROM → TO	TRIGGER	PATH TYPE	DESCRIPTION
10	attachLineage → syncBlocked	no_override_available	Error	No authorized override channel available for this conflict
11	applyOverrideCode → resolve	override_applied	Override	Override code validated and applied from OPS/SRE/AUTO channel
12	applyOverrideCode → syncBlocked	override_rejected	Error	Override code invalid or authority insufficient
13	resolve → syncAllowed	resolved	Clean	Conflict resolved via override strategy; sync may proceed
14	resolve → abort	unresolvable	Error --	Resolution strategy exhausted; conflict cannot be resolved
15	syncBlocked → abort	escalation_timeout	Error --	Escalation window expired without manual intervention
